Quantum Theory’s Uncertainty Principle violates conservation of energy & momentum and invokes matter’s unrealistic creation from, and dissolution into, nothing. In Unified Theory action is an evolute of sharmon with Planck constant h as its quantum. The inviolable conservations of energy and momentum ordain conservation of action, invalidation of the Uncertainty Principle and introduction of the new Principle of Null Action. It has universal applications and is conceptually superior to the old Hamilton’s Principle of Least Action as the latter unrealistically associates turnover of action NOT with variations in but with constant energy & momentum. In Nature, the path chosen by an isolated closed system during a real physical change through a succession of intermediate states from the initial equilibrium state ‘a’ to the final equilibrium state ‘b’ is such that the summation or integration of action covering all variations of energy or momentum is zero or null. Hence the name: “Principle of Null Action”. The new principle has successfully derived the generally accepted equations for the following: Schwinger's Quantum Dynamical Principle, Klein-Gorden Field Equations, Schrodinger Wave Equation, Special and General Relativity, Euler's Equations, Lagrange's Equations, Maxwell Equations for Electromagnetic Radiation, Newton's laws of motion, Thermodynamic Equation of State, Discharge of Capacitance through Inductance & Resistance.

Quantum Theory’s Uncertainty Principle violates conservation of energy and momentum and invokes matter’s unrealistic creation from, and dissolution into, nothing. Our Unified Theory [1, 2] rejects it as unrealistic and re-asserts the inviolability of the conservation of mass-energy and momentum. The ‘action’ ($\Delta E \cdot \Delta t$ or $\Delta p \cdot \Delta x$) being associated with the variation $\Delta E$ in energy E or $\Delta p$ in momentum p is also therefore conserved. This leads to the Unified Theory’s new Principle of Null Action. It is conceptually superior to the conventional Hamilton’s Principle of Least Action as the latter unrealistically associates turnover of action with constant energy or momentum. This is further clarified in sec. 2 below.

1. Enunciation of the Principle of Null Action

In Unified Theory [2] ‘action’ is a dynamic evolute of the sharmon as a physical quantity. Its quantum is the Planck constant $h$. Any and every variation $\Delta E$ in energy E or $\Delta p$ in momentum p is associated with a turnover $\Delta A$ of action A. An increase in energy or momentum generates the action and a decrease expends it:

\[ \pm \Delta E \cdot \Delta t = \pm nh, \quad \ldots \ (1) \]
\[ \pm \Delta p \cdot \Delta x = \pm nh. \quad \ldots \ (2) \]

Here $\Delta E$ and $\Delta p$ are the objectively actual variations, in contrast to the subjectively observed
uncertainties of Heisenberg Uncertainty Principle. The natural conservation of energy and momentum ordains the conservation of action too.

In Nature, the path chosen by an isolated closed system during a real physical change through a succession of intermediate states from the initial equilibrium state `a' to the final equilibrium state `b' is such that the summation or integration of action covering all variations of energy or generalized momentum is zero or null. Hence the name: “Principle of Null Action”.

The summation applies to the micro phenomena wherein the quantum nature of action is revealed. In macro phenomena of gross physical changes the ‘graininess’ of action cannot be appreciated and hence it appears as a continuous physical variable, calling for the integration.

A general case involves inter-conversions between two sets of form of energy or generalized momentum $E_x (x = 1, \ldots, n_1)$ and $E_y (y = 1, \ldots, n_2)$. The total action integral

$$A = \int (\sum \delta E_x - \sum \delta E_y) \ dt = 0,$$

or

$$A = \int \delta F \ dt = 0, \quad \ldots \quad (3)$$

where

$$F = \sum E_x - \sum E_y. \quad \ldots \quad (3a).$$

Here $F$ is a twice differentiable continuous function of $n$ physical variables $q_k (k = 1, 2, 3, \ldots, n)$ of which one, say $q_m = t$, is parametric and canonically conjugate to $E$, and of $q_k$’s mutual derivatives $q_{kr} = dq_k/dq_r \ (r = 1, \ldots, m-1, m+1, \ldots, n)$ which in themselves are continuous functions of $q_k$. That is,

$$F = F (q_k, q_{kr}).$$

The above equations lead to the following “working equations” of this new Principle of Null Action:

$$d/dq_r (\partial F/\partial q_m) - \partial F/\partial q_k = \partial F/\partial q_r \cdot q_{rk} \quad \ldots \quad (4)$$

Their application to any specific case requires expressing $F$ in a suitable form and then solving the resultant (n-1) differential equations.

2. Hamilton’s Principle of Least Action vs Principle of Null Action

In a mechanical system, natural transformations involve inter-conversions between the kinetic energy $T$ and potential energy $V$, so

$$F = T - V = L,$$ the Lagrangian.

Equation (3) transforms to

$$A = \int \delta L \ dt = 0. \quad \ldots \quad (5)$$

It is operationally equivalent to Hamilton’s Principle of Least Action

$$A = \int L \ dt = 0. \quad \ldots \quad (6)$$

The Unified Theory’s concept of associating action turnover with the variation $\Delta E$ in energy $E$ and hence with $\Delta L$ or $\delta L$ in the Lagrangian $L$ as in equation (5) is more logical and realistic than with the unvaried Lagrangian $L$ of Hamilton’s Principle equation (6).
3. Schwinger’s Quantum Dynamical Principle

Schwinger [4] developed a new Quantum Dynamical Principle on Heisenbergian Quantum Mechanics when the Hamilton’s Principle was found inadequate for extension to micro quantum phenomena. If the Lagrangian \( L(\phi, \phi_u) \) is a function of the localized field \( \phi \) and its gradient \( \phi_u = \partial \phi/\partial x_u \) (\( u = 1, 2, 3, 4 \)),

\[
\delta A = \delta \int L \, dt = 0.
\]

But the non-commuting observables \( \phi, \phi_u \) cannot be simultaneously measured at any time. Therefore \( \delta A \) cannot be computed. Moreover, Heisenberg’s Principle of Uncertainty sets \( \delta A \geq 0 \), not identically equal to zero. However, Schwinger showed that

\[
\delta (\phi_1, t_1 \mid \phi_2, t_2) = i/h \langle \phi_1, t_1 \mid \delta A \mid \phi_2, t_2 \rangle \quad ...(7)
\]

are the elements of transformation matrix wherein the necessity of vanishing of \( \delta A \) is removed. Nevertheless, even in eqn. (7), the \( \phi_1 \) and \( \phi_2 \) are not actual magnitudes but the measured observables subject to uncertainties of the Heisenberg Uncertainty Principle.

In Unified Theory’s Principle of Null Action the \( \phi \) and \( \phi_u \) being objectively actual magnitudes, belong to the same eigenstate and hence commute.

Therefore, the Principle of Null Action can be applied and extended to the micro phenomena of Quantum Mechanics as below.

4. Klein-Gordon Field Equations

Let the Lagrangian density \( L(\phi, \phi_u) \) be a function of the scalar field \( \phi \) (of mass \( m \)) and field gradient \( \phi_u \), without explicit dependence on space-time coordinates \( x_u, x_4 = \text{i}ct, c \) being the light velocity in vacuum. Here,

\[
F = L = \frac{1}{2} (\partial \phi/\partial x_u \partial \phi/\partial x_u - m^2 \phi^2), \quad q_k = \phi, \quad q_u = x_u,
\]

\[
q_{kr} = \partial \phi/\partial x_u, \quad d/dq_k (\partial F/\partial q_u) = \Box \phi,
\]

\[
\Box = (\partial^2/\partial x_1^2 + \partial^2/\partial x_2^2 + \partial^2/\partial x_3^2 - 1/c^2 \partial^2/\partial t^2);
\]

\[
\partial F/\partial q_k = -m^2 \phi, \quad \partial F/\partial q_u = 0.
\]

With these substitutions, eqn (4) leads to the Klein-Gordon eqn :

\[
(\Box + m^2)\phi = 0.
\]

5. Schrodinger Wave Equation

In Unified Theory, the kinetic energy \( E \) of a moving particle comprises an aggregate of 0-spin sharmons with an intrinsic electric-cum-magnetic dipole whose natural frequency \( \nu \) is related to \( E \) by \( \nu = E/h \).

This induces electromagnetic dipoles of the same frequency \( \nu \) in the ambient sharmon medium to generate the “sharmon ripple” tightly associated and moving with the moving particle at its velocity \( u \). Its wavelength \( \lambda \) is related to the particle’s momentum \( p \) by \( \lambda = h/p \).

For a particle of mass \( m \), moving with velocity \( u \), momentum \( p \), total energy \( T \) and potential energy \( V \), \( p^2 = m^2 u^2 = 2m(T - V) \). This with the wave equation

\[
\nabla^2 \Psi + 4\pi^2/\lambda^2 \Psi = 0, \quad \nabla^2 = (\partial^2/\partial x^2 + \partial^2/\partial y^2 + \partial^2/\partial z^2)
\]

gives the famous Schrodinger Wave Equation of Wave Mechanics.
\[ \nabla^2 \Psi + (8\pi^2 m/h^3)(T - V) \Psi = 0. \]

Lewis de Broglie was the first to give eqns. \( v = E/h \) and \( \lambda = h/p \) in analogy with the Planck's similar equations for electromagnetic radiation. He called them “matter waves” since material particles exhibit their wave properties through them.

Because it was difficult to fix ideas about their physical nature, Max Born [5] considered them as “probability waves” which guide the moving particle. But Born’s probabilistic interpretation could apply only to ensembles of large numbers of particles and could not explain the diffraction patterns produced by single individual particles and very low intensity light photons.

It is only now that a real physical significance is imparted to the de Broglie wave and Schrödinger wave function, and in fact to the Wave Mechanics. These energetic ripples in the sharmon medium, move tightly associated with the moving particle. The diffraction patterns for single particles are produced by Simple Harmonic variations in the phase and amplitude of these ripples. See detailed presentation in Ref. [2].

6. Special and General Relativity

The general covariance and invariance to Lorentz transformations of eqn. (3) of the Principle of Null Action follow from the fact that all terms in the expression for \( F \) in eqn. (3a) are canonically conjugate to parametric \( t \), and subsequent operations of differentiation and integration are themselves so invariant. Eqn. (4) can therefore be taken over to the theories of Special and General Relativity. Einstein [6] has deduced the equations of General Relativity from Hamilton's Principle, which is operationally equivalent to the Principle of Null Action, as above.

7. Euler’s Equations

When the expression for \( F \) contains \( q_k \& q_{kr} \) but not \( q_r \), \( \partial F/\partial q_r = 0 \), then, eqn. (4) reduces to the Euler’s equations:

\[ \frac{d}{dq_r} \left( \frac{\partial F}{\partial q_{kr}} \right) - \frac{\partial F}{\partial q_k} = 0. \]

8. Lagrange’s Equations

In eqn. (4), let \( F \) be identified with Lagrangian \( L \), \( q_r \) with time \( t \), and \( q_k \) with \( x \), \( q_{kr} = dx/dt = x' \). If in addition, the expression for \( F \) or \( L \) does not explicitly contain \( t \), \( \partial F/\partial q_r = 0 \). Then eqn. (4) leads to the Lagrange’s equations:

\[ \frac{d}{dt} \left( \frac{\partial L}{\partial x'} \right) - \frac{\partial L}{\partial x} = 0. \]

9. Maxwell Equations for Electromagnetic Radiation

The electromagnetic waves propagate in the sharmon medium via contiguous mechanisms, the mediator bosonic “photon” comprising an aggregate of the sharmons [2].

An electric field \( E \) induces an electric dipole \( p_e = lq \) with arm \( l \) and charge \( \pm q \) in the sharmon packet comprising +ve positrinos and -ve negatrinos. Since the deforming force \( qE \) is equal to the restoring force \( q^2/e_0 l^2 \), we have \( q = l^2/e_0 E, p_e = l^3 e_0 E \).

The \( l^3 \) in the \( p_e \) expression becomes the polarizability of the sharmon packet. The displacement charge per unit area of the sharmon packet is nearly \( D = q/l^2 = e_0 E \). And the displacement current density in the sharmon medium is \( I = dD/dt = e_0 dE/dt \).

Since this displacement current in the real sharmon medium is real and solenoidal, it gives rise to a real magnetic field \( H \), so that

\[ \text{curl } H = dD/dt = e_0 dE/dt, \]
\[ \text{div } dD/dt = 0 = \text{div } I. \]
The other two Maxwell equations for the sharmon medium are

\[ \text{div } H = 0 , \]
\[ \text{curl } E = -\mu_0 \frac{dH}{dt} . \]

Maxwell did not question the 19th century views about vacuum as an “empty space”. Therefore his displacement charge & displacement current and hence the electromagnetic waves were only mathematical constructs and exigencies. They all now acquire real physical significance in the context of the omnipresent sharmon medium filling all space.

10. Newton's laws of motion

For an isolated moving particle far removed from other influences, F identifies with its kinetic energy T, q_r with t, and q_k with x. Then equation (4), on using \( dx/dt = x' \), gives

\( x' \frac{d}{dt} \left( \frac{\partial T}{\partial x'} \right) = \frac{\partial T}{\partial t} \)

where \( \frac{\partial T}{\partial x'} \) is the linear momentum.

For the particle starting from rest under the action of a constant force P, T equals the work done by P in moving the particle a distance x, or \( T = Px \) whose partial differentiation with time t gives

\( \frac{\partial T}{\partial t} = Px' . \)

This with eqn (4) gives on division by \( x' \), the Newton's Second Law of Motion

\( \frac{d}{dt} \left( \frac{\partial T}{\partial x'} \right) = P. \)

The Newton's first and third laws of motion are derivable from the second law.

11. A Thermodynamic Equation of State

For a thermodynamic system, the F identifies with the Gibbs thermodynamic potential at constant pressure, \( F = ( H - TS ) \), where \( H = E + PV \) is the total heat content and S is the entropy; E is the internal energy, P the pressure and V the volume. Here the expression for F does not explicitly contain the mutual derivatives \( q_{kr} \). Therefore, in eqn. 16.7, \( d/d_{kr} \left( \frac{\partial F}{\partial q_{kr}} \right) = 0. \)

Identifying \( q_k \) with V and \( q_r \) with T, eqn 16.7 gives

\( [(\partial H/\partial T)_V - T(\partial S/\partial T)_V](\partial T/\partial V)_T + (\partial H/\partial V)_T - T(\partial S/\partial V)_T = 0. \)

Since \( C_v = (\partial H/\partial T)_V = T(\partial S/\partial T)_V \), the above eqn. reduces to

\( (\partial H/\partial V)_T - T(\partial S/\partial V)_T = 0. \)

Differentiation of \( H = E + PV \) with V at constant P gives

\( (\partial H/\partial V)_T = (\partial E/\partial V)_T + P. \)

It can also be shown that \( (\partial S/\partial V)_T = (\partial P/\partial T)_V \). The last 3 eqns. give

\( (\partial E/\partial V)_T = T(\partial P/\partial T)_V - P. \)

This thermodynamical equation is applicable to all states of matter.
Discharge of Capacitance through Inductance & Resistance

If \( I \) is the instantaneous current in the circuit having capacitance \( C \), inductance \( M \), resistance \( R \), and \( q \) the charge on \( C \),

\[
\delta F = \delta \left[ RI \, dt + \delta I \, MI \, dI - \frac{\delta}{\delta q} \, q/C \, dq \right].
\]

Three terms on the right are instantaneous energies of \( R, M, C \).

In eqns. (4), identifying \( q_k \) with \( q \), \( q_r \) with \( t \), \( q_{kr} \) with \( I = dq/dt \), we have

\[
\frac{d}{dt} \left( \frac{\partial F}{\partial I} \right) - I \left( \frac{\partial F}{\partial q} \right) = \frac{\partial F}{\partial t}.
\]

The above two equations with

\[
\frac{\partial F}{\partial I} = \int 2RI \, dt + \int MI, \text{ etc lead to}
\]

\[
RI + M\frac{dI}{dt} + \frac{q}{C} = R\frac{d^2q}{dt^2} + q/C = 0
\]

the well known differential equation for this case.

Summing up remarks

The above deductions of established working equations in diverse phenomena and varied fields of Physics illustrate the universal versatility of the Unified Theory's new Principle of Null Action.
